

Driving Results

From research and planning to action-oriented steps like RFPs and procurement, NEF's telecom consulting solutions propel you forward.

NEF is professional services firm that provides research, analysis, consulting and planning for large infrastructure projects such as fiber optic network deployments, municipal conduit systems, data center site selection and more. Our methodology revolves around a process which takes into account detailed client requirements as well as NEF's knowledge base and resources. With extensive expertise in the telecom and data center industries, NEF presents connectivity and data center solutions that serve initial requirements as well as an organization's long-term best interests. We seek to understand what the needs and challenges are today and how infrastructure needs might change in the future.

— Vendor Neutrality

We sort through all your fiber options to assemble the best solution, regardless of carrier.

— Route Diversity

Different carriers don't always mean truly diverse routes. We always look at who owns the underlying infrastructure.

— Procurement

Our relationships, both in breadth and depth, allow us to negotiate favorable contract terms that give our clients more flexibility.

— Latency Design

We proactively consider latency issues and requirements, ensuring a solution meets your specific enterprise application needs.

— Cost Control

Most importantly, NEF is your advocate to drive down costs. We understand carrier pricing models and have unique insight into available pricing and terms.

— Network Audit

Even when you have solid network in place, NEF can evaluate your network landscape to find cost savings or diversity issues before they become problems.
